Smart made simple.

Radiator Valve

Motion Sensor
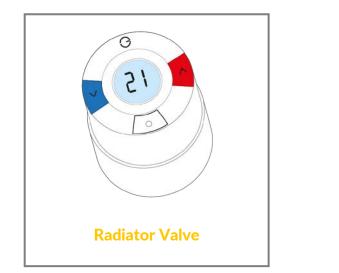

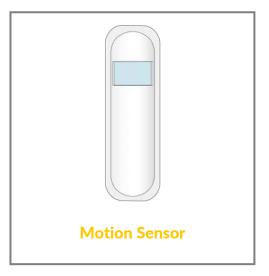

Your room has been fitted with a smart radiator valve which automatically adjusts the temperature in your room at different times of the day for your optimum comfort. Each room is also fitted with a motion sensor which will automatically increase the heating in your room when you are there, and allow it to cool slightly when you leave - reducing your rooms impact on the environment. If you want to increase the temperature or turn down the heating in your room you can easily do it by adjusting the temperature on the radiator valve. The Genius Hub is an award winning state of the art system installed to improve guest comfort and reduce the impacts of heating on the environment.
